Imperva CloudWAF New Feature Updates – September 2020

Imperva CloudWAF – New Feature Updates

September 2020

Policy Management

With Policy Management, you can now easily configure and manage hundreds of sites from a single location. You can create policies at the account level and then apply them to multiple sites. This way, by changing a policy, you immediately change the configuration of all of the sites to which it is applied. You can also set default policies to accounts and sub-accounts, and make sure new sites get the right configuration immediately when they are on-boarded.

HTTP/2 end-to-end and gRPC support

Imperva WAF allows your end-users to use HTTP/2 when connecting to your applications. You can use HTTP/2 from the end-user to the WAF, or continue with HTTP/2 all the way to your origin servers. On top of that, Imperva WAF also supports using Google's gRPC protocol and use Protobuf payload over HTTP/2 traffic.

Imperva CloudWAF – New Feature Updates

September 2020

Swagger 3 support for API Security

Imperva's API Security solution allows you to upload an Open API Definition file to configure the Positive Security Protection for your API. You can now use Swagger3 format in addition to Swagger2 in your API Definition files.

NEW Dashboard for API Security

API Security now has a new dashboard, that provides better visibility to your API protection, including the ability to investigate and drill down to the API Endpoint level.
